Abstract

The present invention relates to integrated antenna structures, integrated electronic component structures and a method for the production thereof. The basic concept of the present invention consists in plastic components (1, 2), for example of a motor vehicle, which are furnished with coating films (3, 3a*, 3b, 3c) as a surface finish being furnished with electronic components, in particular planar antenna architectures or structures (4), which are integrated in films. Various realization variants are disclosed for this purpose.
